Case – frontend development at endre

Your task is to develop a frontend that visualize data from SMHIs forecast data API (https://opendata.smhi.se/apidocs/metfcst/index.html). It's your decision how the frontend should be designed, what data to show and how this data is shown. We prefer that the solution is built using React with Javascript or Typescript. To help you with the visualization, we recommend Apache ECharts.

During your interview we would like you to give a short presentation (about 10 min). In the presentation you should describe how you developed your solution and why you made certain choices. After the presentation we want you to show the solution you built.

Best of luck!
